PUTTING THE BOAT INTO USE

To identify the boat, turn to the APPENDICES:

- Technical specifications (page A-2, A-3),
- Description (page A-4, A-8).

 warning	WHEN ASSEMBLING THE BOAT, IT IS IMPORTANT THAT YOU FOLLOW THE PROCEDURE IN THE CORRECT ORDER. REFER TO THE PAGES INDICATED BELOW FOR STEP BY STEP INSTRUCTIONS.
--	---

Procedure for putting the boat into use and storage	Page	Section
1. Inventory upon opening	2	INVENTORY UPON OPENING
2. Activate the valves to inflation position	3	INFLATION SYSTEM
3. Slightly inflate the buoyancy tube	6	BOAT INFLATION
4. Inflate the buoyancy tube	6	BOAT INFLATION
5. Inflate the H2P floor	6	BOAT INFLATION
6. Inflate the keel	6	BOAT INFLATION
7. Adjust the pressures	9	AIR PRESSURE
8. Store the boat	11	DEFLATION/FOLDING

 warning	IN THE CASE OF QUICK INFLATION, REFER TO THE PARAGRAPH ENTITLED "Quick inflation System"
---	--

INVENTORY UPON OPENING

 warning	DO NOT USE SHARP IMPLEMENTS (CUTTER, KNIFE, ETC...)
--	---

The package of your boat contains 1 buoyancy tube as well as:

Description	ERB 380-400
1. H2P Floor	1
2. Repair kit	1
3. Owner manual (2 volumes)	1
4. Buoyancy tube quick inflation system, including compressed air cylinder	1
5. Cylinder sheath on floor	1
6. Quick keel inflation system	1
7. Equipment stowage bag	1
8. Respirator haversack	1
9. Telescopic paddles	2
10. Inflation pump (1 standard Heavy-duty inflation pump and 1 high-pressure inflation pump)	2
NOTICE	<i>If you wish to replace lifting rings (for davits) you must imperatively attach them to the buoyancy tubes and transom (and not to the floor).</i>

THE INFLATION SYSTEM

The inflation system consists of:

THE INFLATION PUMP

- | | |
|---------------|----------------|
| (a) Adapter | (b) Hose tip |
| (c) Hose base | (d) Air outlet |

To inflate:

- Place the hose tip in the air outlet,
- To inflate correctly, the pump should be flat on the ground,
- The boat will inflate rapidly if pumping is done at a regular calm rhythm,

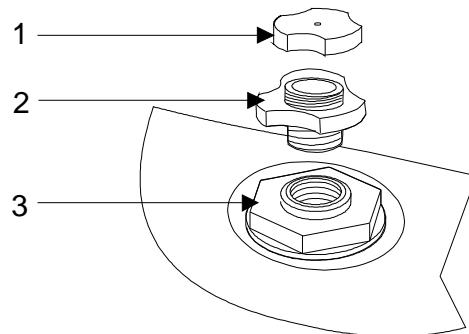

High-pressure
inflation pump
(Bravo 9)

- Use the adapter that corresponds to the diameter of the hose tip valve.

E
N
G
L
I
S
H

THE STANDARD VALVE

- (1) Cap (2) Valve insert (3) Valve base

To activate the valve in the inflation position:

- Remove the valve from its protection,
- Unscrew the cap,
- Screw the valve into its base (tighten fully without damaging the thread), keep the cap at hand.

To close the valve after inflation:

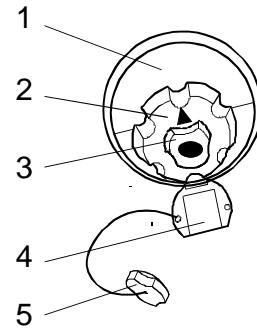

- Screw on the cap.

To deflate the buoyancy tube:

- Unscrew the valve from its base.

INTERCOMMUNICATION VALVES (I/C VALVES)

- (1) Valve base
- (2) Valve wheel
- (3) Valve insert
- (4) Cap cover
- (5) Cap

To activate the valves in the inflation position:

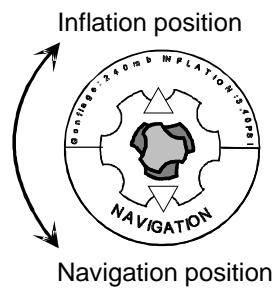

- Position the valve wheel in inflation position (red zone),
- Unscrew the cap,
- Screw the valve insert onto the base (energetically, but do not damage the thread).

To shut off the valves after inflation:

- Position the valve wheel in navigation position (green zone),
- Screw on the cap.

To deflate the buoyancy tube:

- Position the valve wheel in inflation position (red zone),
- Remove the valve insert, with its cap, from the valve wheel.

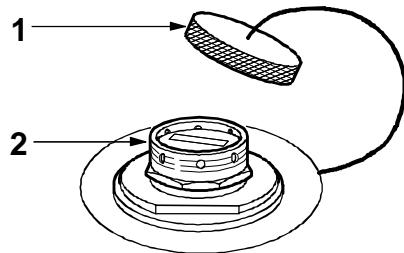

THE INFLATION SYSTEM

O/P VALVES

(1) Cap (2) Valve

Location:

- There are a number of O/P valves in the boat:
 - 1 at the front of the H2P floor,
 - 2 on the buoyancy tube.

warning

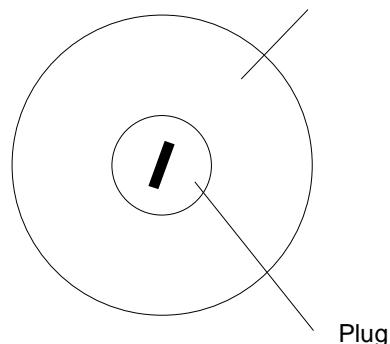

- NEVER INFLATE THE BOAT OR THE H2P FLOOR WHILE THE CAPS ARE ON THE O/P VALVES.
 - REMOVE THE CAPS DURING INFLATION AND REFIT THEM ONCE THIS PROCEDURE IS COMPLETED.
 - DURING NAVIGATION, THE CAPS MUST BE IN PLACE, UNSCREW THEM WHEN THE BOAT IS OUT OF THE WATER.
 - REGULARLY CHECK THEIR FUNCTIONING.
 - TIGHTEN THE CAPS TO THE VALVES WITH JUST A $\frac{1}{2}$ TURN.

ENGLISH

COMPRESSED AIR INFLATION POINTS

Location:

- There are several compressed air inflation points that are used to connect the compressed air bottle for quick inflation:
 - 1 at the back of the H2P floor
 - 2 on the buoyancy tube.

Inflation point

BOAT ASSEMBLY

Assemble the boat on a smooth clean surface.

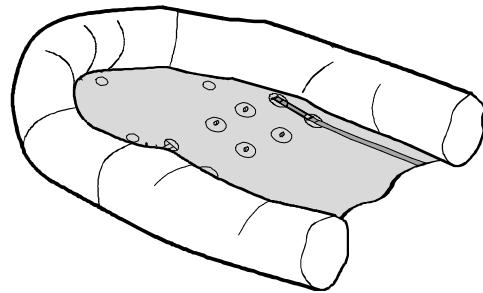

IF THE BOAT IS STORED AT A TEMPERATURE BELOW 0°C, BEFORE UNFOLDING, LET IT WARM UP FOR 12 HOURS AT ROOM TEMPERATURE, 20°C.

ASSEMBLING THE H2P FLOOR

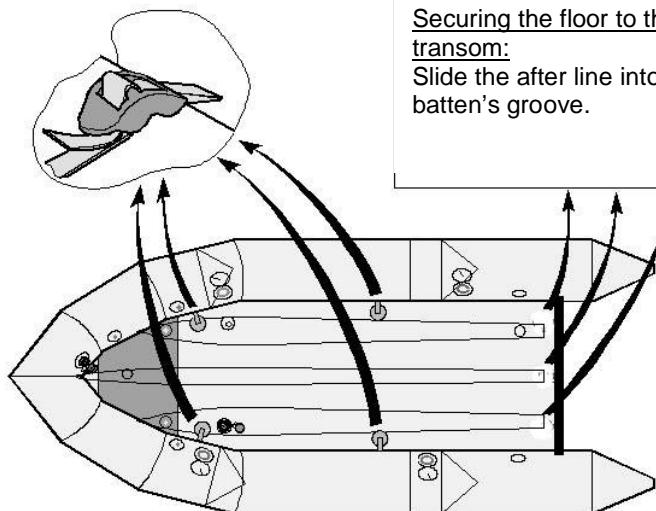

- Place the deflated floor at the bottom of the boat; and make sure the deflated floor is correctly placed in the corner reinforcements.

- Tighten the buoyancy tube / floor and transom/floor fixation buckles.
- Lace the H2P floor to the fabric flap pat the bow

Securing the floor to the transom:
Slide the after line into the batten's groove.

BOAT ASSEMBLY

Two different types of floor option exist for this boat.

Roll-up floor:

E
N
G
L
I
S
H

Rigid floor:

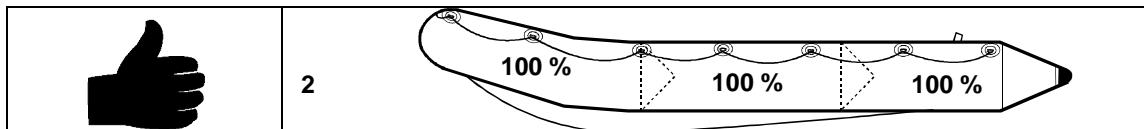

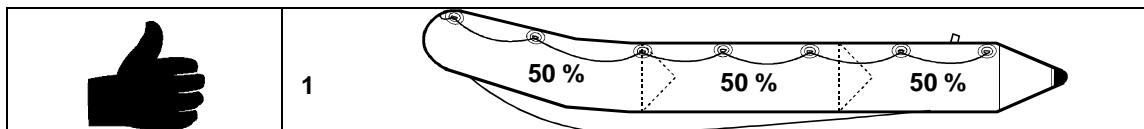

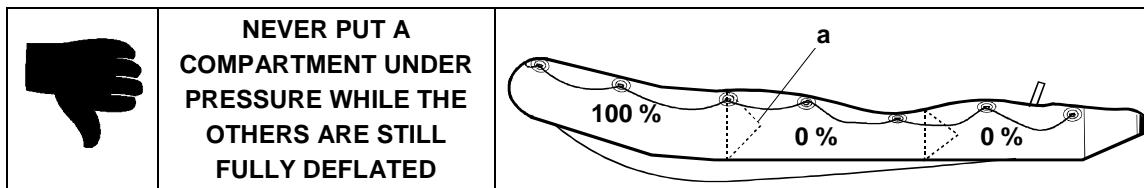

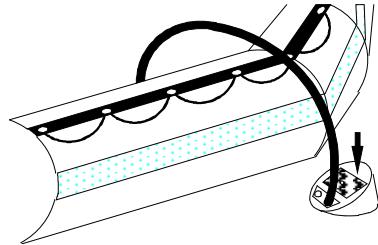

INFLATING THE BOAT USING FOOT OR HAND INFLATION PUMP

Illustration in Appendix of page A-6

NOTICE	Do not inflate boats that are piled up on one another.
---------------	--

- Activate all the valves in the inflation position.
- Attach the pump hose tip to the valve on the buoyancy tube.
- Inflate of the buoyancy, while balancing the pressure between different compartments until the bulkheads (a) are no longer visible (pressure = 240 mb).

INFLATING THE BUOYANCY TUBE

- Inflate the buoyancy tube up to operating pressure.
- Screw the caps after inflation (See appendix on page A6).
- Shut off the valves in "navigation" position.

INFLATING THE H2P FLOOR

- Inflate the H2P floor, after having placed the buoyancy tube in the above configuration.
- Screw the cap after inflation (See appendix on page A6).

NOTICE	A slight loss of air is normal before the cap is screwed on. Only the cap ensures complete air tightness.
---------------	---

INFLATING THE KEEL

- Inflate the keel after having inflated the buoyancy tube and the floor up to operating pressure.
- Screw the cap after inflation (See appendix on page A6).

QUICK INFLATION SYSTEM

GENERAL

ZODIAC quick inflation system permits, in boats equipped with inflation points, an easy inflation of the boat as a whole from a 15 litre compressed air diving bottle.

The inflation system consists of:

- 3 high pressure hoses,
- 1 regulator manometer,
- 3 quick couplings,
- 1 diving bottle.

KEEL HOSE

The keel inflation system consists of:

- Couplings to the main buoyancy tube and element to be inflated,
- Feed hoses,
- Quick connectors.

The couplings can be replaced by standard ZODIAC inflation valves.

The connector is locked by pushing the male part into the female one.

For disconnection, press on the metallic latch.

The hoses can be pulled out from the coupling receptacle by pushing on the ring and pulling out the hose.

Push the hoses into the couplings to ensure proper connection. To deflate the keel either disconnect the hoses couplings or press on the male ends of the hoses.

N
G
L
I
S
H

KEEL INFLATION SYSTEM

Illustration in Appendix of page A-7

INFLATION BOTTLE AND KIT

Illustration in Appendix of page A-8

The inflation bottle can stay in its casing during navigation. Usually, enough air remains in order to allow additional inflation if needed.

The inflation bottle must be filled up on a diving bottle filling bench as per standard regulations applicable to diving bottles.

INSTALLATION

Illustration in Appendix of page A-8

- Check inventory of the quick inflation kit (2) and figure out how to install the diving bottle (1). Piping (7) is the longest.
- Pull out the plug cap from each of the inflation points located as follows:
 - 2 points on the buoyancy tube separated by the transom,
 - 1 point on the inflatable floor.
- Screw the quick couplings (8 and 3) to the inflation points. The black or grooved coupling (3) must be fitted on the inflatable floor.

QUICK INFLATION SYSTEM

- Connect the couplings to the tips of hoses (4 and 7) on the 3 quick couplings (8 and 3) by pushing the hose into the connector.
Check that tips (5) of hoses (4 and 7) are properly screwed to the regulator (6).
- Screw the regulator (6) to the diving bottle (1).
- Place the bottle (1) back into its casing on the transom. Close the quick-release fasteners and tighten the fixing straps.
- Check that the inflation system assembly of the boat is in quick inflation position:
 - Caps of the overpressure valves must be removed,
 - Inflation valves of the bottom and buoyancy tube must be screwed on and the caps closed,
 - The keel inflation hose connectors must be locked,
 - Arrow of I/C valve inserts must be in "GONFLEMENT"(inflation) position.
- Fold the boat starting from the bow towards the transom.
Close the respirator haversack.

INFLATION – NAVIGATION

Illustration in Appendix of page A-9

- Open the bag and slightly unroll the transom in order to reach the valve of the diving bottle.
- Open wide the valve of the bottle. Stay close by in order to re-shut off the valve if necessary.
- Allow the boat to inflate until all the overpressure valves open Re-shut off the valve of the bottle.
- The boat is ready for navigation:
 - Screw the caps to the overpressure valves,
 - Position the arrow of I/C valves on "NAVIGATION",
 - Disconnect the keel inflation hose.

 warning	DURING QUICK INFLATION, CAPS OF OVERPRESSURE VALVES MUST BE REMOVED AND THE VALVES PUT IN "GONFLEMENT" (INFLATION) POSITION. STOP THE INFLATION IMMEDIATELY IF THESE CONDITIONS ARE NOT MET.
---	---

AIR PRESSURE

E
N
G
L
I
S
H

NOTICE

In a boat equipped with valves, put the valves in Inflation position in order to control the pressure.

The service pressure for the buoyancy tube and keel is 240 mbar/ 3.4 PSI, and 1100 mbar/ 16 PSI for the H2P floor.

The boat is fitted with a pressure indicator which provides a quick, efficient readout during inflation.

It is important to foresee pressure changes: Check and adjust pressure in the inflatable compartments (by reinflating or deflating) when temperature changes occur (especially in tropical areas where day-night temperature variations are high). Make sure the pressure is within the recommended zone (220 to 270 mb/green zone).

Temperature of the surrounding air or water will proportionally influence the level of internal pressure in the buoyancy tube.

Ambient temperature	Pressure inside the buoyancy tube
+1°C	+4 mb / 0.06 PSI
-1°C	-4 mb / 0.06 PSI

RISK OF PRESSURE LOSS

Example: The boat is on the beach exposed to the sunlight, the temperature is 50°C, and the boat pressure is the recommend one (240 mb/3.4 PSI). When you launch the boat into 20°C water, temperature and pressure inside the inflatable compartments will both decrease (to 120mb). Consequently the boat must be topped up in order to recover pressure loss due to the difference in temperature (between the surrounding air and the water). It is also normal to experience a pressure loss at the end of the day when outside temperature decreases.

warning

WHEN UNDER-INFLATED, THE BOAT LOSES RIGIDITY IN NAVIGATION AND WILL PERFORM POORLY. IT ALSO TENDS TO AGE PREMATURELY.

RISK OF OVERPRESSURE

Example: The boat is inflated to the recommended pressure (240mb/3.4PSI) at the beginning or end of the day (low outdoor temperature =10°C). Later in the day, the boat is exposed to full sunlight (50°C) either on the beach or on a yacht deck. Temperature inside the inflatable compartments will increase (up to 70°C) especially with a dark colour buoyancy tube, causing the pressure to double (480 mb). Deflating is then necessary to bring the pressure back to the recommended level.

warning

IF THE BOAT IS OVER INFLATED, THE EXCESSIVE PRESSURE EXERTED ON THE INFLATABLE STRUCTURE CAN RUPTURE THE SEAMS.

AIR PRESSURE

IN CASE OF UNDER PRESSURE

Do some topping up:

The standard valve:

- Remove the reinflation compartment cap,
- Inflate to adjust to the operating pressure,
- Screw on the cap.

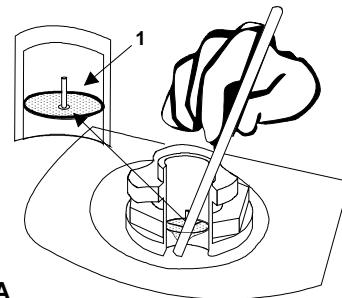

I/C Valve:

- Remove the cap,
- Attach the pump to the valve,
- Position all the valve wheels on "inflation" (red zone),
- Inflate to adjust to the operating pressure,
- Position all the valve wheels on "navigation" (green zone),
- Screw on the cap.

IN CASE OF OVERPRESSURE

Standard valve (A):

- Remove the cap,
- Release some air by lightly pushing down on the diaphragm (1) with a blunt object (such as a pen),
CAUTION: MAKE SURE THE DIAPHRAGM DOES NOT FOLD OVER.
- Screw on the cap.

I/C Valve:

- Remove the cap,
- Position all the valve wheels on "inflation" (red zone),
- Release some air by lightly pushing down on the diaphragm (1) with a blunt object (such as a pen),
CAUTION: MAKE SURE THE DIAPHRAGM DOES NOT FOLD OVER.
- Position all the valve wheels on "navigation" (green zone),
- Screw on the cap.

DISASSEMBLY / MAINTENANCE

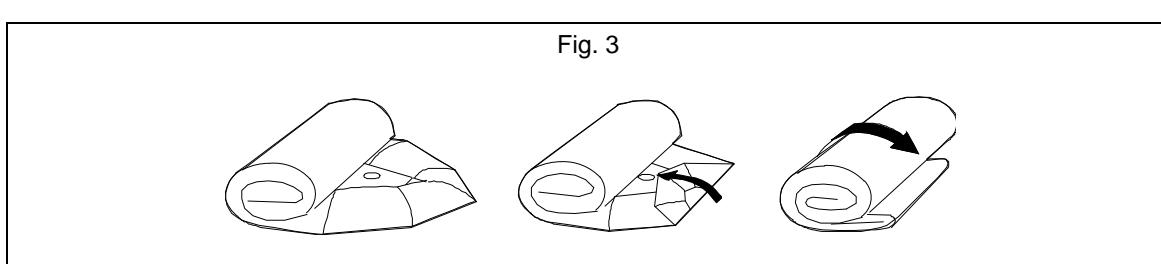

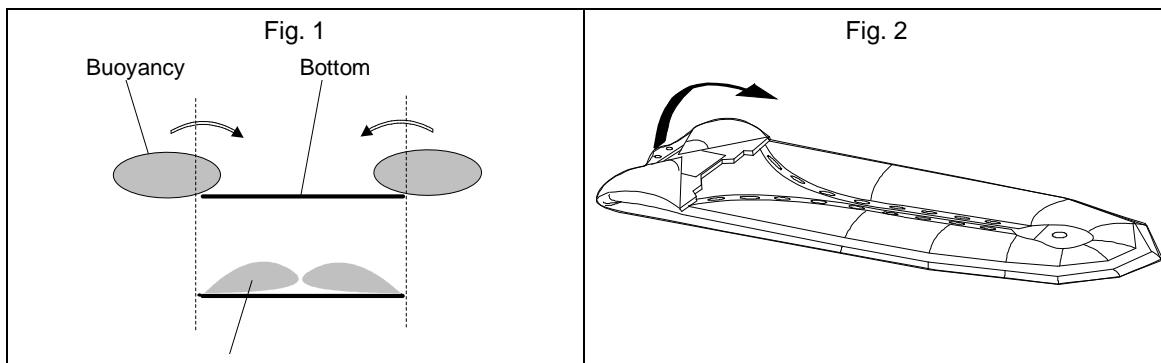

Disassembly / maintenance of the h2p floor

On folding, we recommend that you leave the H2P floor in place in the boat. However, when cleaning the bottom of the boat, where sand and other kinds of residues can accumulate, it is recommended to remove the inflatable floor. Proceed as follows:

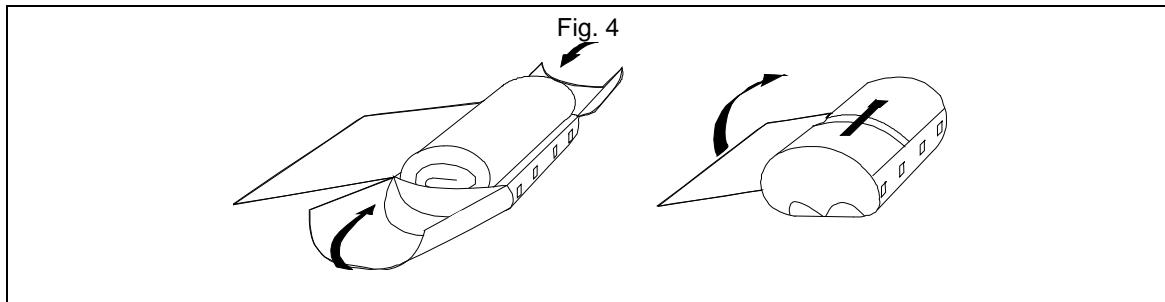

- **DISASSEMBLY:** Deflate the buoyancy tube and the H2P floor.
Open the floor/buoyancy tube fixation buckles.
- **MAINTENANCE:** Slightly re-inflate the boat before rinsing with a water hose in between the buoyancy tube and the bottom then lift up the nose of the boat to drain the water.
Repeat the operation until all sand and residues are removed.

BOAT DEFLECTION / FOLDING

- Remove all various equipment.
- Deflate the boat:
 - Position all I/C valves on " inflation" (red zone),
 - Unscrew the valves.
- Remove the floorboard, execute the assembly procedure in reverse.
- Refit the valves on the I/C valves.
- Remove the self bailer caps.
- Rinse the boat with fresh water:
 - Partly inflate the boat in order to facilitate cleaning and drying operations,
 - Remove the sand and clean stains with soapy water,
 - Drain all water and leave the boat to dry before folding it.
- Fold both sides of the buoyancy tube toward the interior of the boat (Fig. 1), bring up the cones against the transom (Fig. 2) then fold the boat on itself around the transom (Fig. 3).
Start again if you notice that some air remains in the buoyancy tubes.

- Place the boat in the bag using the following procedure (Fig. 4):
 - Place the buoyancy tube in a bag,
 - Fold over the top and buckle the front cords,
 - Then close tightly by pulling the lateral tightening cords, making sure no accessories are sticking out.

STORING THE INFLATED BOAT AFTER USE

To store the inflated boat:

- The boat must be stowed slightly under-inflated.
- Open the self bailer valves,
- Rinse the boat with fresh water and remove any sand seaweed and shells,
- Drain water from the boat,
- Store the boat in a way that no water can remain inside.
